

=====

🕒 SECTION 1 – INTRODUCTION (0:00 to 1:30)

📌 SCREEN: Show your Desktop or Browser Home Page

=====

"Hello everyone, my name is Naga Sai.

I am a Data and Business Analyst Intern at Labmentrix.

Today I am going to present my Project 7 –
Cricbuzz LiveStats: Real-Time Cricket Insights
and SQL-Based Analytics Dashboard.

This project was assigned to me by Labmentrix,
and I have successfully completed it.

Let me first give you a quick overview of what this project is about.

Cricbuzz LiveStats is a web-based cricket analytics application
that does the following things:

First – It connects to the Cricbuzz REST API from RapidAPI
to fetch live, recent, and upcoming cricket match data.

Second – It uses a MySQL database with 9 tables
to store player data, match data, and statistics.

Third – It has 25 SQL practice queries
from beginner level to advanced level.

Fourth – It has full CRUD operations,
meaning we can Create, Read, Update, and Delete records.

Fifth – Everything is displayed using a beautiful web dashboard
built with Python and Streamlit.

The tech stack I used for this project is:

- Python 3
- Streamlit (for the web dashboard)
- MySQL 8.0 (for the database)
- Cricbuzz REST API from RapidAPI (for live data)
- Pandas (for data handling)
- Plotly (for charts and visualizations)
- mysql-connector-python (to connect Python with MySQL)
- python-dotenv (to securely store API keys and passwords)

Now let me show you the complete project step by step."

=====

🕒 SECTION 2 – PROJECT FOLDER STRUCTURE (1:30 to 2:30)

📌 SCREEN: Open File Explorer → Go to project 7 folder

=====

"Let me first show you the project folder structure.

[📁 OPEN: File Explorer → C:\labmentrix internship\project 7]

You can see here we have the following files and folders:

- The .streamlit folder – this has the Streamlit configuration
- The pages folder – this has all 5 pages of our dashboard
- The utils folder – this has the database connection
and the API helper files
- main.py – this is the main entry point of our application

- requirements.txt – this lists all Python libraries needed
- cricbuzz_schema.sql – this has the complete database schema and all sample data
- .env file – this stores our API key and database password securely
- README.md – this is the project documentation file

[📁 OPEN: pages folder and show the files]

Inside the pages folder we have:

- home.py – the home page
- live_matches.py – live cricket matches page
- player_stats.py – player statistics page
- sql_analytics.py – the SQL queries page
- crud_operations.py – the CRUD operations page

[📁 OPEN: utils folder and show the files]

Inside the utils folder we have:

- db_connection.py – handles MySQL database connection
- api_helper.py – handles all Cricbuzz API calls"

=====

🕒 SECTION 3 – DATABASE SETUP (2:30 to 4:00)

📺 SCREEN: Open MySQL Workbench

=====

"Now let me show you the database setup.

[💻 OPEN: MySQL Workbench → Click Local instance MySQL80]

I am using MySQL 8.0 as my database.

The database name is cricbuzz_db.

[📁 CLICK: cricbuzz_db → Click Tables to expand]

You can see here we have 9 tables in our database:

1. teams – stores all international cricket teams
2. venues – stores all cricket stadiums with their capacity
3. players – stores player profiles with their roles and batting styles
4. series – stores cricket series information
5. matches – stores match results and details
6. batting_stats – stores match-level batting scores
7. bowling_stats – stores match-level bowling figures
8. fielding_stats – stores catches, stumpings and run-outs
9. career_stats – stores aggregated career statistics for each player

Let me quickly show the data in one table.

[🖱️ RIGHT CLICK: teams table → Select Rows]

You can see we have 20 international cricket teams stored in our database including India, Australia, England, Pakistan, South Africa and more.

[🖱️ RIGHT CLICK: players table → Select Rows]

And here we have 41 player records with their full name, country, playing role, batting style and bowling style all stored properly.

This is the complete relational database design

that supports all our SQL queries and dashboard features."

```
=====
🕒 SECTION 4 – RUNNING THE APPLICATION (4:00 to 5:00)
📌 SCREEN: Open CMD
=====
```

"Now let me show you how to run the application.

[🖥️ OPEN: CMD – Command Prompt]

I will navigate to my project folder first.

[📄 TYPE IN CMD:]
cd C:\labmentrix internship\project 7

Now I will run the Streamlit application using this command:

[📄 TYPE IN CMD:]
streamlit run main.py

[🕒 WAIT: Browser opens automatically at localhost:8501]

You can see the message –
'You can now view your Streamlit app in your browser'
at Local URL: <http://localhost:8501>

The browser has opened automatically with our dashboard.
Let me switch to the browser now."

```
=====
🕒 SECTION 5 – HOME PAGE (5:00 to 5:45)
📌 SCREEN: Browser → localhost:8501 → Home Page
=====
```

"This is the Home Page of our Cricbuzz LiveStats dashboard.

[🖱️ SCROLL DOWN slowly on the Home page]

At the top we have a beautiful green banner with the project name
– Cricbuzz LiveStats.

Below that we have 4 metric cards showing:
→ Live Matches – Via API, real-time
→ Players – 20 plus players in database
→ SQL Queries – 25 practice queries
→ DB Tables – 9 MySQL tables

Scrolling down we can see the Navigate the App section
which explains what each page does.

Further down we have the Tech Stack section
showing all the technologies used.

And at the bottom we have the complete folder structure
for reference.

On the left sidebar we can see all 5 navigation pages:
Home, Live Matches, Player Stats, SQL Analytics, and CRUD Operations.

Let me now click on each page one by one."

```
=====
```

🕒 SECTION 6 – LIVE MATCHES PAGE (5:45 to 7:00)

📌 SCREEN: Browser → Click "Live Matches" in sidebar

=====

"[🖱️ CLICK: Live Matches in the left sidebar]

This is the Live Matches page.

It has 3 tabs – Live Now, Recent, and Upcoming.
All data here comes directly from the Cricbuzz REST API.

[🖱️ CLICK: Live Now tab]

In the Live Now tab you can see currently ongoing matches
with a red LIVE badge.

For each match we can see:

- The two teams playing
- The series name and format
- The venue and city
- Current score – runs, wickets, and overs
- Match status

[🖱️ CLICK: Recent tab]

In the Recent tab we can see recently completed matches
in a table format with all match details.

[🖱️ CLICK: Upcoming tab]

And in the Upcoming tab we can see future scheduled matches
with their date and venue.

This live data updates every time we refresh the page
because it is fetched directly from the Cricbuzz REST API."

=====

🕒 SECTION 7 – PLAYER STATS PAGE (7:00 to 8:00)

📌 SCREEN: Browser → Click "Player Stats" in sidebar

=====

"[🖱️ CLICK: Player Stats in the left sidebar]

This is the Player Statistics page.

It has 3 tabs – ICC Batting Rankings, ICC Bowling Rankings,
and DB Career Stats.

[🖱️ CLICK: ICC Batting Rankings tab]

Here we can see the ICC batting rankings
fetched live from the Cricbuzz API.

The format is currently set to ODI.
We have a table showing rank, player name, country, and rating.

On the right side we have an interactive bar chart
created using Plotly showing the top 10 batsmen ratings.

[🖱️ CLICK: Format dropdown → Select 'test']

We can change the format to Test – the rankings update automatically.

[🖱️ CLICK: ICC Bowling Rankings tab]

Similarly this tab shows ICC bowling rankings with the same table and chart format.

[🖱️ CLICK: DB Career Stats tab]

And this tab shows career statistics directly from our MySQL database for all players across different formats."

=====

🕒 SECTION 8 – SQL ANALYTICS PAGE (8:00 to 10:00)

📍 SCREEN: Browser → Click "SQL Analytics" in sidebar

=====

"[🖱️ CLICK: SQL Analytics in the left sidebar]

This is the most important page of our project – the SQL Analytics page with 25 SQL practice queries.

[🖱️ SHOW: Filter by Level dropdown]

We can filter queries by difficulty level:

→ Beginner level – basic SELECT, WHERE, GROUP BY queries

→ Intermediate level – JOINS, subqueries, aggregate functions

→ Advanced level – window functions, CTEs, complex analytics

Let me run a few queries to demonstrate.

--- QUERY 1 ---

[🖱️ SELECT: Q1 – India Players from dropdown]

[🖱️ CLICK: View SQL – show the SQL code briefly]

This query finds all players who represent India. Let me click Run Query.

[🖱️ CLICK: Run Query button]

We get 5 rows returned –

Virat Kohli, Rohit Sharma, Jasprit Bumrah, Ravindra Jadeja, and KL Rahul with their playing role and batting style.

--- QUERY 2 ---

[🖱️ SELECT: Q3 – Top 10 ODI Run Scorers]

[🖱️ CLICK: Run Query button]

This shows the top ODI run scorers.

We can see Virat Kohli at the top with 13906 runs and a batting average of 57.32 with 50 centuries.

--- QUERY 3 ---

[🖱️ SELECT: Q5 – Team Win Counts]

[🖱️ CLICK: Run Query button]

This shows how many matches each team has won.

India leads with 6 wins, followed by Australia with 3 wins.

--- QUERY 4 ---

[🖱️ SELECT: Q17 – Toss Advantage Analysis from Advanced level]

[🖱️ CLICK: Run Query button]

This is an advanced query that analyzes whether winning the toss gives a team an advantage. We can see the win percentage for teams that chose to bat first versus teams that chose to bowl first.

[🖱️ SCROLL DOWN: Show Custom SQL Query section]

We also have a Custom SQL Query editor at the bottom. Anyone can write their own SQL query here and run it directly on the live database.

Let me type a quick example:

[📄 TYPE: SELECT full_name, country FROM players WHERE playing_role = 'Bowler']
[🖱️ CLICK: Run Custom Query]

We get all bowlers from our database – it works perfectly."

=====

🕒 SECTION 9 – CRUD OPERATIONS PAGE (10:00 to 11:30)

📍 SCREEN: Browser → Click "CRUD Operations" in sidebar

=====

"[🖱️ CLICK: CRUD Operations in the left sidebar]

This is the CRUD Operations page.
CRUD stands for Create, Read, Update, and Delete.

This page has 2 tabs – Players and Matches.

[🖱️ CLICK: Players tab]

At the top we can see all players currently in our database displayed in a table.

Below that we have 3 action options:
Add Player, Update Player, and Delete Player.

Let me demonstrate adding a new player.

[🖱️ CLICK: Add Player radio button]

A form appears where I can fill in:

→ Full Name
→ Country
→ Date of Birth
→ Playing Role
→ Batting Style
→ Bowling Style
→ Team

[📄 FILL IN THE FORM:]

Full Name: Test Player Demo

Country: India

Playing Role: Batsman

Batting Style: Right-hand bat

[🖱️ CLICK: Add Player button]

The player has been added successfully!
You can see it appearing in the table above as the last record.

Now let me show the Update feature.

[🖱️ CLICK: Update Player]

We can select any player and update their details.
The form automatically loads their existing data
which we can modify and save.

And finally the Delete feature –

[🖱️ CLICK: Delete Player]

We can select any player and permanently delete them
from the database with one click.

[🖱️ CLICK: Matches tab]

Similarly the Matches tab allows us to
add new matches or delete existing match records
with a form-based interface."

=====

🕒 SECTION 10 – CLOSING (11:30 to 12:00)

📍 SCREEN: Browser → Go back to Home Page

=====

"[🖱️ CLICK: Home in the left sidebar]

So this is the complete Cricbuzz LiveStats project.

Let me quickly summarize what we have built:

- ✅ A real-time cricket analytics dashboard
- ✅ Connected to the Cricbuzz REST API for live data
- ✅ MySQL database with 9 tables and 40 plus player records
- ✅ 25 SQL queries from beginner to advanced level
- ✅ Full CRUD operations for data management
- ✅ Interactive charts using Plotly
- ✅ A clean multi-page Streamlit web application

The skills I gained from this project are:

- SQL query writing from basic to advanced level
- REST API integration with Python
- Database design and normalization
- Web application development using Streamlit
- Data visualization using Plotly
- Secure application configuration using environment variables

I would like to thank Labmentrix for giving me
this wonderful project opportunity
which helped me grow as a data analyst.

Thank you for watching this demo.
If you have any questions please feel free to ask.

[🛑 STOP ZOOM RECORDING]"
